

The 2019 Duke Lemur Center life history data update

Sarah Zehr, Data Manager, Duke Lemur Center

All photos by David Haring

Figure 1. A few of the infants born at the DLC since the previous data release. Left to Right: *Daubentonia madagascariensis* 7279 Agatha, *Eulemur flavifrons* 7291 Gellar, *Propithecus coquereli* 7234 Hostilian, *Eulemur coronatus* 7247 Kek, *Lemur catta* 7240 Griselda, *Varecia rubra* 7298 Judith. A total of 130 animals have been added to the data. See below for more details.

Overview

This document contains details relating to the Duke Lemur Center (DLC) data update released in February 2019. The update contains the same file types released with the original manuscript in 2014 and includes additional data collected over the intervening years. For all variable definitions, methods, and usage notes, please refer to the original manuscript, which can be viewed here:

<https://www.nature.com/articles/sdata201419>

A description of this February 2019 data update and the ways in which it differs from the original data sets (released with the original manuscript, August 2014) are given below, followed by a table of errors that have been uncovered and corrected in the interim. Most of the errors reported are extremely minor (e.g. misspelling of an animal's name, duplicate weight entry) and should have no impact on prior analyses but are included in case they can help with clarification.

I have tried to include enough detail so that those who have used the 2014 data release can determine whether this update would improve sample sizes or add substantial information to prior projects, or whether any errors uncovered would be likely to impact previous results. As a result, this document will be excruciatingly boring to most readers. For that I apologize.

How to download data

You can download the updated datasets from two locations – directly from the DLC website and from the curated data repository Dryad. Both locations contain both the original and updated data releases and all associated information.

Download via the DLC website here:

<https://lemur.duke.edu/duke-lemur-center-database/>

Download from Dryad here:

<https://datadryad.org/resource/doi:10.5061/dryad.fj974>

How to cite

Zehr, SM, Roach RG, Haring D, Taylor J, Cameron FH, Yoder AD. Life history profiles for 27 strepsirrhine primate taxa generated using captive data from the Duke Lemur Center. *Sci. Data*1:140019 doi: 10.1038/sdata.2014.19 (2014).

If publishing results generated from downloaded data, please include file date (found in data file name) in citation

Contact

For more information or to report errors, please contact the DLC Data Manager (Dr. Sarah Zehr, sarah.zehr@duke.edu).

What is in the February 2019 data update?

Like the original data release before it, this update contains the following data file types:

Reference and analytic versions of the DLC life history table. The tables contain summary statistics for 91 different variables across 27 different strepsirrhine species. The summary values have been recalculated using the updated raw datasets described below. It may be easier to look up specific data points using the reference version (27 species columns x 91 variable rows). The analytic version (91 variable columns x 27 species rows), though more difficult to read, can be imported directly into statistical software for analysis. The reference version is only available via the DLC website.

DLC Animal List raw data.

The DLC Animal List data file contains 32 variables for 3,749 individuals representing 27 taxa in all stages of life. These are the raw data used to calculate longevity and reproductive variables in the life history tables.

DLC Weight File raw data.

The DLC Weight data file contains 33 variables relating to 82,6109 weight measurements across 2270 individuals and 27 taxa. These are the raw data used to calculate body mass variables in the life history tables.

Species List and Data Paper

The species list (including taxonomic abbreviations) and original published paper (containing methods and usage notes) are still applicable to the updated data and remain available for use.

How does the February 2019 Update differ from the original 2014 data release?

Changes found in this update are described by category below.

Additional Animals

There are 130 animals in the February 2019 update that were not included in the 2014 data release. Numbers, by species, are as follows:

Species Code	Genus Species	N Added
CMED	<i>Cheirogaleus medius</i>	7
DMAD	<i>Daubentonia madagascariensis</i>	7
ECOL	<i>Eulemur collaris</i>	4
ECOR	<i>Eulemur coronatus</i>	7
EFLA	<i>Eulemur flavifrons</i>	14
EFUL	<i>Eulemur fulvus</i>	3
EMON	<i>Eulemur mongoz</i>	4
ERUF	<i>Eulemur rufus</i>	1
LCAT	<i>Lemur catta</i>	7
MMUR	<i>Microcebus murinus</i>	16
NPYG	<i>Nycticebus pygmaeus</i>	4
PCOQ	<i>Propithecus coquereli</i>	37
VRUB	<i>Varecia rubra</i>	12
VVV	<i>Varecia variegata variegata</i>	7
TOTAL		130

Table 1. Animals added to the data, summarized by species.

Category: Taxonomic change. There are three animals included because of changes to standard taxonomy. Two of these (DLC_IDs = 5562, 5563) were formerly assigned to species *Eulemur mayottensis*, where sample size (2) was too small to be included in the 2014 data set. That species is now standardly accepted to be an isolated population of *Eulemur fulvus* (an included species) as proposed by Mittermeier *et al* (1994). The third (DLC_ID = 4566) was previously categorized as "unverified taxonomy" but further investigation into the pedigree reveals that the correct taxonomy is also *Eulemur fulvus*.

Category: Births. The update contains 88 new DLC births, 25 births at other institutions to DLC-owned animals, and 4 additional births at other institutions that occurred prior to 2014 but were previously unreported.

Category: Transfers in. There were 10 animals that were not previously part of our historic colony and transferred into the DLC colony from other institutions since the 2014 publication (DLC_IDs = 7194, 7245, 7285, 7236, 7271, 7218, 7219, 7261, 7272, 7287).

Other Taxonomic changes

In the 2014 release, there were 16 animals classified as *Eulemur* hybrids that were potentially not hybrids because at least one potential sire is of a species that matches the remainder of the animal's ancestry. Further investigation has verified that 8 of these are definite hybrids (DLC IDs = 5553, 5554, 5801, 5802, 5933, 5934, 6087, 6212). As in the original data release, the remaining 8 animals with

unknown hybrid status (DLC IDs = 1574, 2513, 2550, 2551, 3527, 3561, 1553, 2566) are identifiable in the output because their taxonomic code (Eul) indicates a hybrid animal but their hybrid status is 'N' whereas status for known hybrids is 'Sp'.

Animals Removed.

There are 8 animals that were included in the 2014 data release that are not in the February 2019 update.

Category: Taxonomic change. All 8 animals are galagos that were previously identified as *Galago moholi* (a species included in the 2014 release) that have subsequently been found to be either *Galago senegalensis* (1 animal – DLC_ID = 1065), or *Galago sp.* hybrids (Gmoh x Gsen; 7 animals – DLC_IDs = 2020, 2021, 2043, 2044, 2062, 2096, 2097). *Galago sp.* hybrids and *Galago senegalensis* both have sample sizes too small to be included in this analysis (5 and 13 individuals respectively).

Mortality.

There are 186 additional dates of death reported in the February 2019 update that were not in the 2014 release. Most of these deaths (149) are of animals that were included (as living) in the 2014 release. The rest (37) are animals that have been added to the colony after the 2014 release and died (e.g. stillborn infant).

Of all deaths, 167 have occurred since the 2014 release at the DLC or another institution where the animal resided. The additional 19 are animals that died at other institutions prior to the 2014 release but were previously unreported.

Last verified living age of animals with unknown status.

There are 84 animals whose last verified age has been updated since the 2014 release, which can affect censored survival analyses. When a DLC animal is donated to another institution, our records no longer automatically update with living status. However, records for all animals from the historic DLC population can be accessed in the Zoological Information Management System (ZIMS). If the holding institution has entered information that verifies the animal was living on a particular date (live animal weights, animal transfers), it can be used to recalculate the age that the animal was last known to be alive. A search for more recent dates of verified "live" status has resulted in an increase in "last verified age" in these 84 cases. If the search found an animal reclassified as dead, it would be counted in the Mortality section described above.

There are 44 living animals that have been donated to other institutions since the 2014 release, so their age is now reflected as "last verified age" as documented above rather than "age of living" as in the previous release.

Parentage

Category: DLC parents. DLC dam IDs have been added for 19 animals, and DLC sire IDs have been added for 15 animals. These are data that were missing in the previous release.

Category: Parents at other institutions. In the 2014 data release, parents that were not part of the DLC colony did not show up in the output so as to avoid confusion in cases where the local ID number at the other institution matched a local ID number in the DLC colony (which would have subsequently pulled up incorrect associated information for that parent). In this update, non-DLC parent ID numbers are included and contain an "oi_" prefix to indicate the ID number is that of an "other institution". This may allow additional patterns of relatedness to be uncovered. Data for 120 dams and 110 sires at other institutions have been added.

Studbook Numbers

Not all studbook numbers have been identified and entered into the animal's individual record. More have been added in this release, but there are still many that are missing. Approximately 23% of studbook numbers were missing in the 2014 release, compared to 20% in this update. The vast majority of missing values are for galagos (88% are *Otolemur garnettii* or *Galago moholi*) and will be updated once the next galago studbook is published.

Expected Gestation Times

An analysis of the dates of observed breeding behaviors (copulations and/or sperm plugs) and dates of subsequent infant birth resulted in an adjustment of values used for expected gestation times, ranges, and calculation of estimated dates of conception for 10 species.

Species	Previous Values			Updated Values		
	Low	High	Calculator	Low	High	Calculator
<i>Cheirogaleus medius</i>	60	64	60	59	65	62
<i>Daubentonia madagascariensis</i>	157	172	165	.	.	164
<i>Eulemur collaris</i>	120	128	120	.	126	123
<i>Eulemur coronatus</i>	120	126	120	.	.	124
<i>Eulemur flavifrons</i>	120	129	120	124	130	128
<i>Eulemur mongoz</i>	120	128	120	123	128	127
<i>Lemur catta</i>	130	136	130	.	142	138
<i>Microcebus murinus</i>	57	63	60	60	64	63
<i>Varecia rubra</i>	98	102	98	.	107	103
<i>Varecia variegata variegata</i>	98	102	98	.	107	104

Table 2. Summary of changes to gestation times. **Low:** low end of observed range. **High:** high end of observed range.

Calculator: the single number most likely to generate the most accurate gestation time (based on the frequency and distribution of values within the range); used to calculate estimated date of conception (infant DOB – calculator = estimated DOC). A "." under Low or High updated values means there was no change from previous value. Previous values were used in the 2014 data release. Analysis and adjustments occurred in February 2016, and updated values are reflected in this 2019 update.

Weights

Category: new weights. There are 82,609 weights in the updated file, including 17,201 new weights that were not in the 2014 release. The majority of these (17,133) are weights that have been obtained since the original publication, with a few additional entries (68) extracted from older records or edited.

The table below shows a breakdown of newly available weights by species and age class. This should help users of the earlier release determine if these updated data will potentially contribute to ongoing projects. Definitions of age classes can be found in the original manuscript.

Species Code	Genus species	All New Weights	Infant/Juvenile	Young Adult	Adult
CMED	<i>Cheirogaleus medius</i>	2,571 (25)	156 (7)	154 (9)	2,261 (25)
DMAD	<i>Daubentonia madagascariensis</i>	743 (19)	85 (4)	144 (5)	513 (13)
EALB	<i>Eulemur albifrons</i>	13 (1)			13 (1)
ECOL	<i>Eulemur collaris</i>	298 (8)	43 (2)	53 (4)	202 (6)
ECOR	<i>Eulemur coronatus</i>	581 (21)	134 (9)	107 (9)	340 (18)
EFLA	<i>Eulemur flavifrons</i>	752 (30)	290 (16)	80 (12)	382 (17)
EFUL	<i>Eulemur fulvus</i>	3 (1)	1 (1)		2 (1)
EMAC	<i>Eulemur macaco</i>	189 (3)			189 (3)
EMON	<i>Eulemur mongoz</i>	530 (20)	121 (7)	64 (7)	345 (16)
ERUB	<i>Eulemur rubriventer</i>	194 (6)			194 (6)
ERUF	<i>Eulemur rufus</i>	86 (2)			86 (2)
ESAN	<i>Eulemur sanfordi</i>	9 (1)			9 (1)
EUL	<i>Eulemur hybrid</i>	80 (4)			80 (4)
HGG	<i>Hapalemur griseus griseus</i>	216 (3)			216 (3)
LCAT	<i>Lemur catta</i>	1,606 (44)	198 (11)	130 (14)	1,278 (42)
LTAR	<i>Loris tardigradus</i>	15 (1)			15 (1)
MMUR	<i>Microcebus murinus</i>	5,362 (65)	310 (14)	142 (15)	4,910 (61)
NCOU	<i>Nycticebus coucang</i>	58 (1)			58 (1)
NPYG	<i>Nycticebus pygmaeus</i>	356 (11)	49 (2)	13 (3)	294 (7)
OGG	<i>Otolemur garnettii garnettii</i>	43 (3)	41 (3)		
PCOQ	<i>Propithecus coquereli</i>	2,218 (52)	767 (27)	413 (22)	1,038 (30)
VRUB	<i>Varecia rubra</i>	789 (25)	206 (9)	85 (9)	498 (18)
VVV	<i>Varecia variegata variegata</i>	489 (17)	105 (8)	89 (7)	295 (12)
TOTAL		17,201 (363)	2,508 (120)	1,475 (116)	13,218 (288)

Table 3. Summary of new weights included in this release. In each category, the first number is the number of weights and the number in parentheses is the total number of individuals represented in that category.

Category: weights removed. There were 251 weights in the 2014 release that have been removed from this update. In 131 cases there were two entries for the same weight on the same date and the duplicate entries were removed. In 120 cases, weights that were entered into multiple source files on the same date did not match exactly; the correct weights were identified using original hand-written weight files and the erroneous entries deleted. An additional 26 entries contained typos and were corrected. Details of the weights that were removed or edited can be found in the corrections table (below).

Weight note: in a few cases, there are multiple different weights for the same animal on the same day. This can happen for two reasons. First, an animal under medical care, particularly an infant, may be weighted multiple times in a single day to monitor growth/health. Second, there are times when an animal is weighed by both the husbandry and veterinary staff in a single day; these weights may change slightly over the course of the day and if they do not match exactly, both will show up in the data. This was also the case in the original 2014 data release but it was not specifically highlighted. All weights are left in the file in case those potential variations are of interest to any researchers.

Corrections

There have been 398 errors uncovered and corrected since the 2014 data release. The vast majority of these are minor and should have no discernable effect on studies conducted with the 2014 data. Most (283) involve weight data as described above. There were another 45 very minor updates in the Name variable, where a name that was assigned to a second individual of a species is differentiated from the first by adding "II" to the name (they have unique DLC_ID#s, but we prefer name to be unique as well). This is standard practice but had not been followed through for some individuals in the historic colony. The table contains details of the corrections to taxonomy, parent IDs, gestation length, and hybrid status described above. Finally, specifics of a few changes to DOB, DOD, studbook number, and sex are described.

Table of corrections. Please see original manuscript for all variable definitions and abbreviations. If taxonomy or name has been changed, the Species Code and Name variables in the table reflect the new (correct) information.
